AIMS AND SCOPE

The aim of the journal is to communicate the results of original research in a variety of clinical and scientific specialities concerned with *in utero* diagnosis of fetal abnormality in man (and animal models) resulting from genetic and environmental factors. This is considered to encompass genetic and other forms of screening aimed at identifying pregnancies at risk of fetal abnormality; the epidemiology and pathology of fetal abnormality (including fetal infection); fetal and maternal factors relating to intrauterine development; antenatal care in relation to the treatment and prevention of fetal abnormality; genetic counselling and selective termination of pregnancy; psychosocial aspects of prenatal diagnosis; the development and evaluation of services for prenatal diagnosis; developments in the field of obstetric ultrasound, fetoscopy and fetal blood sampling; the application of recombinant DNA technology and genetic linkage to the prenatal diagnosis of single gene defects; advances in amniotic cell culture techniques for the prenatal diagnosis of chromosome aberrations and metabolic defects.

EDITORIAL POLICY

The overriding criteria for publication are originality, a high scientific quality and interest to a wide audience of those concerned with all aspects of prenatal diagnosis research. The journal provides a multidisciplinary forum for the exchange of information by which it is hoped to increase knowledge about the aetiology and pathogenesis of fetal abnormality and to promote further opportunities for its treatment and prevention. Papers not sufficiently substantiated by experimental detail will not be accepted, and although technical queries will be referred back to the author, the Editor reserves the right to make alterations in the text without altering the technical content.
